designing machines that can read handwriting like human beings has been an ambitious goal for more than half a century driving talented researchers to explore diverse approaches obstacles have often been encountered that at first appeared insurmountable but were indeed overcome before long yet some open issues remain to be solved as an indispensable branch chinese handwriting recognition has been termed as one of the most difficult pattern recognition tasks chinese handwriting recognition poses its own unique challenges such as huge variations in strokes diversity of writing styles and a large set of confusable categories with ever increasing training data researchers have pursued elaborate algorithms to discern characters from different categories and compensate for the sample variations within the same category as a result chinese handwriting recognition has evolved substantially and amazing achievements can be seen this book introduces integral algorithms used in chinese handwriting recognition and the applications of chinese handwriting recognizers the first part of the book covers both widespread canonical algorithms to a reliable recognizer and newly developed scalable methods in chinese handwriting recognition the recognition of chinese handwritten text is presented systematically including instructive guidelines for collecting samples novel recognition paradigms distributed discriminative learning of appearance models and distributed estimation of contextual models for large categories in addition to celebrated methods e g gradient features mqdf and hmms in the second part of this book endeavors are made to create a friendlier human machine interface through application of chinese handwriting recognition four scenarios are exemplified grid assisted input shortest moving input handwritten micro blog and instant handwriting messenger all the while the book moves from basic to more complex approaches also providing a list for further reading with literature comments

this book describes a fundamentally new theoretical framework for finding poor algorithms in an application program and replacing them with ones that parallelize the code parallel computation will become the norm in the coming decades unfortunately advances in parallel hardware have far outpaced parallel applications of software there are currently two approaches to applying parallelism to applications one is to write completely new applications in new languages but abandoning applications that work is unacceptable to most nonacademic users of high performance computers the other approach is to convert existing applications to a parallel form this can be done manually or automatically even partial success in doing the job automatically has obvious economic advantages this book describes a fundamentally new theoretical framework for finding poor algorithms in an application program and replacing them with ones that parallelize the code
